This game looks really good and almost runs smoothly on each map.

However, I think I'm having some weird bug.

I have my mouse and keyboard all connected and working, but for some reason I can't control any of the characters in the game. I really want to play this fighting game, but as I can't control the fighter, they go into somekind of a demo/automatic mode and fight automatically.

Does anyone else have a similar bug?. Doesn't contain a game mode and a tad overpriced IMO.

Other than that it works and it measures your GPU\VCPU performance.. Excellent Benchmark when building your own pc.. This program is great for testing stability after overclocking GPU's. I wish the free version had the option to disable the demo, but I purchased to make that option available while supporting the developer.. Won't install new "module" based tests, so that's cool.. I believe this test is too demanding for it looks. There are less demanding tests that look better, but it has another porpose and it is understandable. Perfect stability test for major overclocking.. Doesn't contain a game mode and a tad overpriced IMO.

Other than that it works and it measures your GPU\VCPU performance.. My goto for benchmarking my overlocks for my computer.. I am addicted to benchmarking my PC's. even when I already know they suck! I can't help it! this is my go to app for detailed, accurate and meaningful test results. I recommend anyone who builds PC's and wants to verify performance, is looking for a bottleneck in their system or is just curious on how their system stands up to stressful test situations at least download the free demo. I personally after having it couldn't do without the full suite,It was well worth the money I paid for it. (however much that was I don't remember!). I can't believe they charge \$25 STANDARD for this junk, It should be on sale for \$.99 at MOST just to allow people to gamble and see if it MIGHT work. I just installed it and none of the tests work, all give me errors that bring up nothing on google or their website. It's pretty pathetic when a free version of something works better than the paid one. Disgusting.

I have a fair few items in my library. Some I have played, a lot not even installed. So from now on I will install, and play each item for at least an hour.

These will be my first impressions not full on reviews as an hour is not a great deal of time. So please keep this in mind. Also keep in mind these are MY impressions I do not expect you all to agree so don't shoot me.

For me 3DMark is a good little program for checking what your pc can do. That's it to be honest. Yes when it's checking your GPU the videos are great to watch, but once you watched once well you seen it.

The only reason I have over 3hrs on this, is that I left it running while I went out one day.

Do I recommend this hmm tough choice. If you tinker often with your GPU setting etc. than yes it's a nice looking program. If you're not and you just want to see what your GPU can do then no. You will use 2 or 3 times and then like me you're happy with your settings that's it.

So if you can get this at a heavy reduced cost, then get it. If not they are plenty not so pretty programs out there, that do the same job for free.

. Ah, the Golden Standard for the overclocking enthusiast and commons alike. Easy to run and gives a clear score of everything. Never skip the demo, just for fun.. Won't install new "module" based tests, so that's cool.. This program is great for testing stability after overclocking GPU's. I wish the free version had the option to disable the demo, but I purchased to make that option available while supporting the developer.. Still the most stable benchmark I've found for pushing my equipment to its max (then knocking it back down a bit so it's also stable in badly optimised games!)

Highly recommend, even for testing stability in basic systems and new HDDs/RAM/CPU changes.. \*Part of 3DMark. My goto for benchmarking my overlocks for my computer.. Very taxy stabby swordy thingy majik
