patients with acute coronary syndrome surviving to discharge between 1989 and 2005: the from the FAST-MI registry. There are limited data on the natural history and the clinical characteristics of patients with ACS following hospital discharge. The FAST-MI registry was designed to describe the outcome of 17,921 patients with ACS who survived to discharge from 992 hospitals in France. Patients were followed from index hospitalization until death, readmission for ACS, or last follow-up, whichever was earliest. The mean age was 60.5 years and 31.4% were women. The mean length of stay was 16.5 days. During the study

---

period, the proportion of patients presenting with ST-segment elevation myocardial infarction (STEMI) decreased from 53% to 26%, and those presenting with non-STEMI increased from 47% to 64%. The index admission, mortality and readmission rates were 8.2%, 3.2% and 5.2%, respectively. There was a decrease in the readmission rate for ACS over time (0.62, 0.50, 0.47 per 100 persons-year from 1993 to 2005). Despite remarkable clinical improvement, there was an increase in 1-year mortality (13.8, 14.7, 16.1 per 100 persons-year), a decrease in mortality at 1 year (from 14.2 to 11.9 per 100 persons-year) and

---

a decrease in life expectancy (18.4 to 17.3 years). At 1 year, 15.6% of patients had symptomatic heart failure. There was a greater proportion of STEMI and younger patients with presentation beyond the 'Golden Time', and patients were less likely to receive evidence-based therapy after discharge. In conclusion, the outcomes of contemporary ACS patients after discharge from the index hospitalization f678ea9f9e
